

G13DLF – NAG Fortran Library Routine Document

Note. Before using this routine, please read the Users' Note for your implementation to check the interpretation of bold italicised terms and other implementation-dependent details.

1 Purpose

G13DLF differences and/or transforms a multivariate time series. It is intended to be used prior to G13DCF to fit a vector autoregressive moving average (VARMA) model to the differenced/transformed series.

2 Specification

```
SUBROUTINE G13DLF(K, N, Z, IK, TR, ID, DELTA, W, ND, WORK, IFAIL)
INTEGER K, N, IK, ID(K), ND, IFAIL
real Z(IK,N), DELTA(IK,*), W(IK,*), WORK(K*N)
CHARACTER*1 TR(K)
```

3 Description

For certain time series it may first be necessary to difference the original data to obtain a stationary series before fitting a VARMA model. This routine also allows the user to apply either a square root or a log transformation to the original time series to stabilize the variance if required.

If the order of differencing required for the i th series is d_i , then the differencing operator is defined by $\delta_i(B) = 1 - \delta_{i1}B - \delta_{i2}B^2 - \dots - \delta_{id_i}B^{d_i}$ where B is the backward shift operator, that is $BZ_t = Z_{t-1}$. Let d denote the maximum of the orders of differencing, d_i , over the k series. The routine computes values of the differenced/transformed series $W_t = (w_{1t}, w_{2t}, \dots, w_{kt})^T$ for $t = d + 1, d + 2, \dots, n$ as follows;

$$w_{it} = \delta_i(B)z_{it}^*, \quad \text{for } i = 1, 2, \dots, k$$

where z_{it}^* are the transformed values of the original k -dimensional time series $Z_t = (z_{1t}, z_{2t}, \dots, z_{kt})^T$.

The differencing parameters δ_{ij} , for $i = 1, 2, \dots, k$; $j = 1, 2, \dots, d_i$ must be supplied by the user. If the i th series does not require differencing, then $d_i = 0$.

5 Parameters

- | | |
|--|--------------|
| 1: K — INTEGER | <i>Input</i> |
| <i>On entry:</i> the dimension, k , of the multivariate time series. | |
| <i>Constraint:</i> $K \geq 1$. | |
| 2: N — INTEGER | <i>Input</i> |
| <i>On entry:</i> the number, n , of observations in the series, prior to differencing. | |
| <i>Constraint:</i> $N \geq 1$. | |

- 3:** Z(IK,N) — **real** array *Input*
On entry: Z(i, t) must contain, z_{it} , the i th component of Z_t , for $i = 1, 2, \dots, k$; $t = 1, 2, \dots, n$.
Constraints:
 if TR(i) = 'L', then Z(i, t) > 0.0 and
 if TR(i) = 'S', then Z(i, t) ≥ 0.0 , for $i = 1, 2, \dots, k$; $t = 1, 2, \dots, n$.
- 4:** IK — INTEGER *Input*
On entry: the first dimension of the arrays Z, DELTA and W as declared in the (sub)program from which G13DLF is called.
Constraint: IK $\geq K$.
- 5:** TR(K) — CHARACTER*1 array *Input*
On entry: TR(i) indicates whether the i th time series is to be transformed, for $i = 1, 2, \dots, k$.
 If TR(i) = 'N', then no transformation is used;
 If TR(i) = 'L', then a log transformation is used;
 If TR(i) = 'S', then a square root transformation is used.
Constraint: TR(i) must equal either 'N', 'L' or 'S', for $i = 1, 2, \dots, k$.
- 6:** ID(K) — INTEGER array *Input*
On entry: the order of differencing for each series, d_1, d_2, \dots, d_k .
Constraint: $0 \leq ID(i) < N$, for $i = 1, 2, \dots, k$.
- 7:** DELTA(IK,*) — **real** array *Input*
Note: the second dimension of the array DELTA must be at least max(1, d) where $d = \max(ID(i))$.
On entry: if ID(i) > 0 , then DELTA(i, j) must be set equal to δ_{ij} , for $j = 1, 2, \dots, d_i$; $i = 1, 2, \dots, k$.
 If $d = 0$, then DELTA is not referenced.
- 8:** W(IK,*) — **real** array *Output*
Note: the second dimension of the array W must be at least Nd.
On exit: W(i, t) contains the value of $w_{i,t+d}$, for $i = 1, 2, \dots, k$; $t = 1, 2, \dots, n - d$.
- 9:** ND — INTEGER *Output*
On exit: the number of differenced values, $n - d$, in the series.
- 10:** WORK(K*N) — **real** array *Workspace*
- 11:** IFAIL — INTEGER *Input/Output*
On entry: IFAIL must be set to 0, -1 or 1. For users not familiar with this parameter (described in Chapter P01) the recommended value is 0.
On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors detected by the routine:

IFAIL = 1

On entry, $K < 1$,
or $N < 1$,
or $IK < K$.

IFAIL = 2

On entry, $ID(i) < 0$, for some $i = 1, 2, \dots, k$,
or $ID(i) \geq N$, for some $i = 1, 2, \dots, k$.

IFAIL = 3

On entry, at least one of the first k elements of TR is not equal to 'N', 'L' or 'S'.

IFAIL = 4

On entry, one or more of the elements of Z is invalid, for the transformation requested; that is, the user may be trying to log or square root a series, some of whose values are negative.

7 Accuracy

The computations are believed to be stable.

8 Further Comments

The same differencing operator does not have to be applied to all the series. For example, suppose we have $k = 2$, and wish to apply the second order differencing operator ∇^2 to the first series and the first order differencing operator ∇ to the second series:

$$w_{1t} = \nabla^2 z_{1t} = (1 - B)^2 z_{1t} = (1 - 2B + B^2)z_{1t}, \text{ and}$$

$$w_{2t} = \nabla z_{2t} = (1 - B)z_{2t}.$$

Then $d_1 = 2, d_2 = 1, d = \max(d_1, d_2) = 2$, and

$$\text{DELTA} = \begin{bmatrix} \delta_{11} & \delta_{12} \\ \delta_{21} \end{bmatrix} = \begin{bmatrix} 2 & -1 \\ 1 \end{bmatrix}.$$

9 Example

A program to difference (nonseasonally) each of two time series of length 48. No transformation is to be applied to either of the series.

9.1 Program Text

Note. The listing of the example program presented below uses bold italicised terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
